Installation of ModLon II Gateway Kit 541–1149

GENERAL INFORMATION

This instruction sheet describes the installation of a ModLon II Gateway kit in FT-10 and TP/XF-78* networks.

* The ModLon unit is an FT-10 Device. When connecting to a TP/XF-78 network, there are some special requirements. See the Template 5 section, starting on page 14.

The following parts are included in this kit.

Part Description	Qty
ModLon II Gateway Control	1
RS-232 Cable	1
LonWorks Support CD	1

In addition to physical connections, this instruction sheet also includes information on binding and register mapping of the following modules to a ModLon II Gateway.

- Controls Communications Module – Genset (CCM-G)
- Controls Communications Module – ATS (CCM-T)
- Digital I/O Module (DIM)
- PCC 3100 Genset Communications Module (GCM)
- PCC 3200 Genset LONWORKS® Card (GLC)
- PCC 2100 Network Communications Module (NCM)
- PowerCommand® Automatic Transfer Switch (ATS) Network Communications Module (NCM)

REQUIRED SOFTWARE

The following software is required to incorporate this kit into your network.

- LonMaker™ for Windows®

- Device Monitoring Software – The communication parameters of the ModLon II Gateway are configurable through LonMaker for Windows. Choose appropriate software that will communicate with user's chosen parameters.

  If ModScan® software is selected to monitor devices, see the "Optional Software" listed below and the information included under "Using ModScan Software," starting on page 15.

- WinZip® – Software used to decompress downloaded files.

OPTIONAL SOFTWARE

- ModScan Software – Used to verify communications between the PCC network devices and the ModLon.

  A fully functional demo version of ModScan software can be downloaded from the Internet at http://www.Win-Tech.com. Click on the "Free Trial Demos" button. Under "Win32 ModBus® Applications," click on the ModScan32.zip file and select an appropriate file location to store the software.

DESCRIPTION

The ModLon II Gateway provides a direct Echelon LonWorks network interface to any device that can communicate:

- ModBus RTU*

  OR

- ModBus ASCII*

This module translates LonWorks network protocol into ModLon ASCII or RTU. Figure 1 is a block diagram of the ModLon II Gateway.

* ModLon II supports Function Code 06 and does not support Function Code 16.

Refer to the *PowerCommand Network Installation and Operation Manual* (900–0529) for instructions on network topology, wiring, and software installation.

The ModLon II Gateway (see Figure 2) has a network connector on the front for connection to network data and a DB9 connector on the top for connection to an RS-232 port.

Externally the ModLon II Gateway has a DC power connector input, a Service (SVC) pushbutton, Service (SVC) LED, Reset (RST) pushbutton, MODBUS LED, OK LED, LON LED, Termination Switch, and a Template Selection Dipswitch.

FIGURE 1. MODLON II GATEWAY BLOCK DIAGRAM

FIGURE 2. MODLON II GATEWAY OUTLINE DRAWING

Termination Switch

The termination switch is located on the bottom of the ModLon II Gateway (see Figure 3). The termination switch is a doubly terminated bus topology termination circuit.

FT-10 Networks can be configured as either multi-drop bus topology (as TP/XF-78 networks are configured) or free topology. Networks configured as a multi-drop bus must be terminated at each end of the bus with a multi-drop bus terminator circuit. Free topology networks must have one free topology type terminator somewhere in the network. The ModLon II has a multi-drop bus terminator. Place the terminator in the "On" position to use this terminator in a multi-drop bus network. If the ModLon II is installed in a free topology network, place the terminator in the "Off" position.

NOTE: Power Command FT-10 devices (CCMs, DIMs, NCMs, GCMs) have free topology terminators. If an FT-10 network is used in a multi-drop bus topology network, use the bus topology terminator (300–5729) to terminate the network. Refer to *FT-10 Power-Command Network Installation and Operation Manual* (900–0529) for more information on network topology termination.
FIGURE 3. MODLON II GATEWAY TERMINATOR SWITCH

MODLON II GATEWAY INSTALLATION

If there is a site network installation drawing, refer to it for the ModLon II Gateway location. If a site network installation drawing is not available, refer to the *PowerCommand Network Installation and Operation Manual* (900–0529) for network topology and maximum network length. **All wiring must follow a specific network topology and must fall within distance limits.** Refer to individual instruction sheets for information on installing additional network devices.

Choose a clean, flat, vibration-free mounting surface. Avoid locations that are hot, damp, or dusty. The temperature range must not exceed –4°F (–20°C) to 140°F (60°C).

Power Supply

The ModLon II Gateway has a DC power connector (see Figure 5) that connects to a power supply from one of the network devices. The ModLon must have a 9–32 VDC power input to function properly.

NETWORK TOPOLOGY AND DATA MEDIA

Refer to the "Network Hardware and Wiring" section of the PowerCommand Network Installation and Operation Manual for information on the network topology and data transmission media.

⚠WARNING *AC voltages and currents present an electrical shock hazard that can cause severe personal injury or death. Only trained, experienced personnel are to perform the following procedures.*

Connections

Network data connections are made at the network connector (LON connector) for LonWorks network data and at a DB9 connector for connection to an RS-232 port. (Connectors and the cable supplied with the ModLon II Gateway are shown in Figure 5.)

Template Selection Dipswitch

The Template Selection Dipswitch (see Figure 4) sets the state for the ModLon. Dipswitch settings are listed in Table 1.
FIGURE 4. MODLON II GATEWAY DIPSWITCH, PUSHBUTTONS, AND LEDS

TABLE 1. DIPSWITCH SETTINGS

#SW 1 2 3 4	Template	Figure Ref.
0 0 0 0	1 (FT-10)	9
0 0 0 1	2 (FT-10)	10
0 0 1 0	3 (FT-10)	11
0 0 1 1	4 (FT-10)	12
0 1 0 0	5 (TP/XF-78)	13
1 0 0 0	Download	–
FIGURE 5. MODLON II CONNECTIONS

SWITCH AND LEDs

The ModLon II Gateway includes two pushbuttons and four status LEDs (see Figure 4).

Service Pushbutton and Service LED

The Service (SVC) pushbutton is used during installation (when prompted by the LonMaker program). **It is important to press the service switch on the ModLon II Gateway that is part of the permanent site. The service switch should only be pressed during installation.**

The green Service LED lights when the service push button is pressed. The LED blinks when the ModLon II Gateway is unconfigured and is off if the ModLon II Gateway is configured. The LED remains on if an unrecoverable error is detected.

Reset Pushbutton

The Reset (RST) pushbutton should not be used during or after installation for any reason.

Status LEDs

The ModLon has three status LEDs (MODBUS, OK, and LON) on the front panel. The MODBUS and LON LEDs indicate communication status on the two ports, whereas the OK LED indicates the ModLon mode.

TABLE 2. LED FUNCTIONS

MODBUS LED	
Status	**Description**
Momentary Flashing while communicating with Network/Software	Communication occurring with the MODBUS port
Off	No Communication on the MODBUS port
OK LED	
Status	**Description**
Off	No Power to ModLon
Fast Blinking	ModLon is waiting for download
Steady on	ModLon is On
LON LED	
Status	**Description**
Off	No communication on LON
Momentary Flashing while communicating with Network/Software	Communication occurring with the network and the LON

NETWORK INSTALLATION

Read the "Introduction" and "Network Hardware and Wiring" sections of the *PowerCommand Network Installation and Operation Manual* (900–0529) before constructing the network.

ModLon Configuration

Configuration variable nciNodeCfg allows the user to set the ModLon variables baud rate, parity, data bits, stop bits, mode selection, and device ID through LonMaker for Windows (see Table 3). This variable has to be set according to the specifications of the FT-10 or TP/XF-78 network.

TABLE 3. VARIABLE SETTINGS

Byte	Variable	Setting
8–6	Baud Rate	1200 – 115200
5	Parity	0 – None 1 – Odd 2 – Even
4	Data Bits	7 or 8
3	Stop Bits	1 or 2
2	Mode Selection	0 – ASCII 1 – RTU
1	Device ID	1
0	Not used	Not used

STANDARD BAUD RATES	B_8	B_7	B_6
1200	0	12	0
2400	0	24	0
9600	0	96	0
14400	1	44	0
19200	1	92	0
38400	3	84	0
57600	5	76	0
115200	11	52	0

The two settings shown below are the default settings, FT-10 and TP-78, for the first ModLon unit.

For example, the old ModLon unit setup in FT-10 configurations would be:

Baud Rate:	38,400
Parity:	0
Data Bits:	8
Stop Bit:	1
Mode Selection:	1 (RTU)
Device ID:	1

B_8	B_7	B_6	B_5	B_4	B_3	B_2	B_1	B_0
3	84	0	0	8	1	1	1	0
0	96	0	2	7	1	0	1	0

Refer to Figure 6 and Figure 7 for examples of the ModLon II unit being configured as the default parameters of the first ModLon in LonMaker.

To set *nciModLonCfg*, right click on the ModLon stencil and select Browse. Change the values of the nciModLonCfg in the Browse window accordingly and click on Set Value. You will get an error message (see Figure 8) that can be ignored; click Close and refresh the Browse screen to confirm the new values. Make sure to note that the ModLon is configured the same as in the "Using ModScan Software" section (starting on page 15).

NOTE: The default configuration for ModLon II is ASCII Mode. The configuration should be changed to RTU Mode, using LonWorks (see Figure 6).
FIGURE 6. nciModLonCfg SETTINGS FOR FT-10 NETWORK
FIGURE 7. nciModLonCfg SETTINGS FOR TP/XF-78 NETWORK
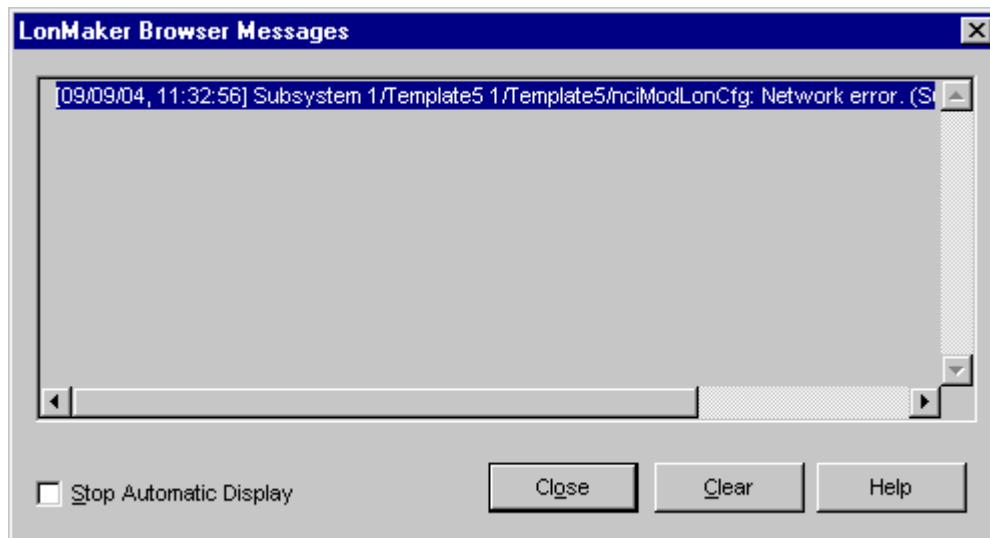

FIGURE 8. ERROR MESSAGE WHEN CHANGING THE MODLON II CONFIGURATION

FT-10 Networks

The "Using LonMaker for Windows" section of the *FT-10 PowerCommand Network Installation and Operation Manual* (900–0529) provides a detailed description of the network installation process, including the following step-by-step installation procedures:

1. Setting up Network Installation Tools

2. Registering Plug-Ins

3. Using LonMaker for Windows Software

4. LonMaker for Windows Network Setup

5. Adding Devices with LonMaker for Windows

6. Installing Bindings with LonMaker for Windows

7. Installing Software Upgrades to an Existing Network

The ModLon II includes five possible ModLon options, four that are the same as the old FT-10 ModLon and the fifth option mimics the TP/XF-78 register maps. A device template is available in LonMaker for Windows for each of these templates.

Possible bindings to a ModLon II Gateway are shown in Tables 4 (Template 1), 5 (Template 2), 6 (Template 3), 7 (Template 4), and 8 (Template 5).

nvoATSStatus	→	*nviATSStatus[..]*		

Template 5

This template uses the same register map as the TP-78 devices. This will allow for upgrading from TP-78 Networks with FT-10 devices with out having to change the monitoring software. The "Network Installation – LonMaker" section of the *FT-10 PowerCommand Network Installation and Operation Manual* (900–0529) provides a detailed description of the network installation process, including the following step-by-step installation procedures:

1. Setting up Network Installation Tools
2. Starting LonMaker Software
3. Using LonMaker Software
4. LonMaker Network Setup
5. Connecting Devices with LonMaker
6. Installing Devices with LonMaker
7. Testing Devices and Verifying Installation

Possible bindings to a ModLon II Gateway are shown in Table 8.

The ModLon is an FT-10 Device. Therefore when it is connected to a TP/XF-78 device or network, it must be separated by a router. However, if you are using just the topology of the TP/XF-78 template for an FT-10 network, there is no need to separate the ModLon with a router.

TABLE 8. TP/XF-78 NETWORK MODLON BINDINGS – TEMPLATE 5

GCM ModBus Interface (ModLon):

Possible bindings to a ModLon Interface:

PCC w/GCM		ModLon

nvoNodeStatus	→	nviCCMStatus[..]		
nvoSensorData	→	nviCCMEngData[..]		
nvoSpareAnalog	→	nviSpareAnalog		

DIM ModBus Interface (ModBus):

Possible bindings to a ModLon Interface:

ModLon		DIM		
nvo16RelayA[..]	→	nvi16RelayA	*16 Relays*	**Control**
nviDIMStatus[..]	←	nvoNodeStatus	*Node*	**Status**

USING MODSCAN SOFTWARE

ModScan is a tool that can help you verify communications between the PowerCommand Network devices you have installed and the ModLon.

Notes

The following notes apply to using ModScan with FT-10 and TP/XF-78 networks.

Genset Control

- Start/Stop – When this register is set to "1," the genset starts, synchronizes, and closes its breaker. As long as this register remains a "1," the genset will continue to run. When this register is set to "0," the genset stops.

- Fault Reset – This should be a momentary signal of about 2 seconds duration. Entering a "1" in the fault reset register resets any non-active warning and, If there is not a remote start on the genset, it resets any non-active shutdown except the Emergency Stop.

- Emergency Stop (TP/XF-78 networks only) – When this register is set to "1," the emergency stop is active at the PowerCommand control. The emergency stop cannot be rest until this register is set to "0." After the register is reset to "0," the emergency stop must be reset at the PowerCommand control. It cannot be reset remotely.

Miscellaneous

- Fault State – As part of Gen Status State, digital value 4 (Fault State 1) = shutdown with an active run command (cannot be remotely reset) and digital value 5 (Fault State 2) = shutdown with no active run command (can be remotely reset).

- Fault Text (TP/XF-78 networks only) – These are 8 words (16 ASCII characters, 2 characters per word) that spell out the actual active fault.

- Genset Status Error – This a value that is not supported by the genset and therefore, has no meaning or function.

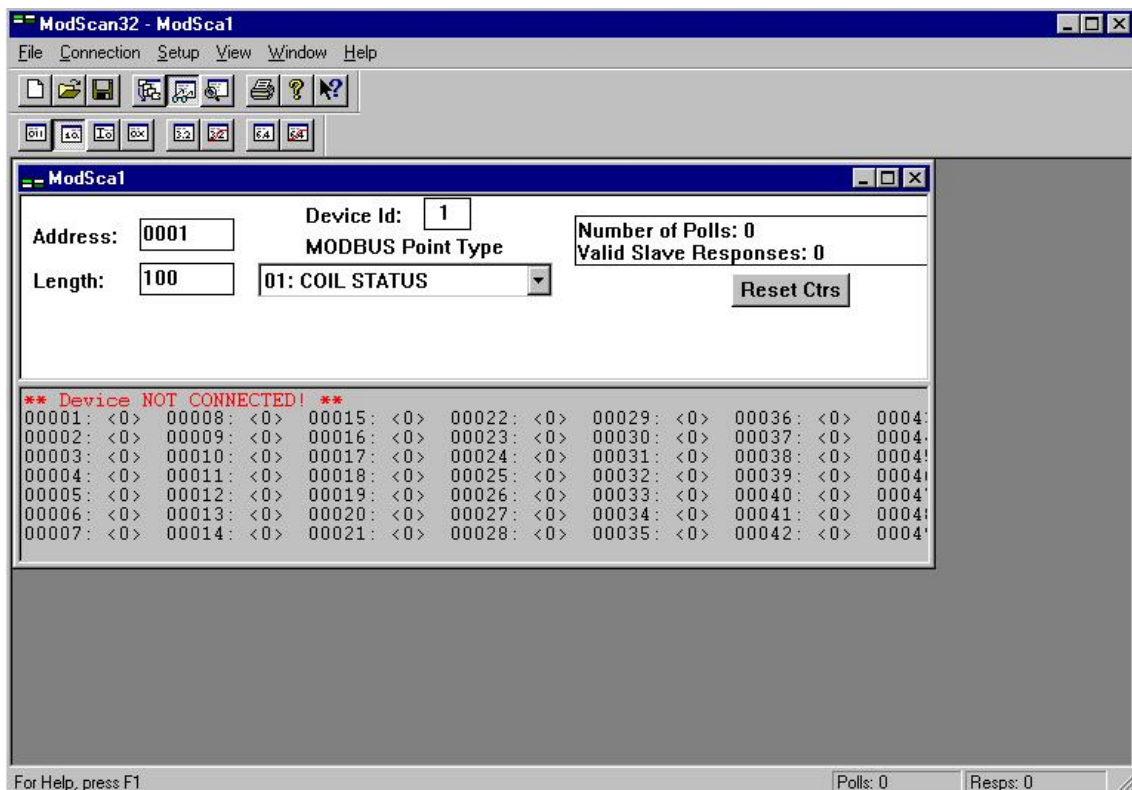

FIGURE 14. MAIN MODSCAN SCREEN

Use ModScan software after this kit has been incorporated into your network. An RS-232 straight-through cable must be installed between the PC serial port and the RS-232 connector on the ModLon II Gateway. Figure 15 shows the initial screen displayed upon launching the program.

1. From the tool bar, select Connection → Connect. The Connection Details dialog box is displayed (see Figure 16). The Device ID is 1.

FIGURE 15. MAIN MODSCAN SCREEN

FIGURE 16. FT-10 NETWORK CONNECTION DETAILS DIALOG BOX

2. Use the pull down menu under "Connect Using" to select the comm port you wish to use.

   For FT-10 networks, a typical configuration would be set to Baud Rate: 38400, Word Length: 8, Parity: None,and Stop Bits: 1, as shown in Figure 16. Use the pull down menus to change these settings as necessary.

3. Click on the "Protocol Selections" button and change the Transmission Mode to "RTU" (see Figure 17). Click "OK."

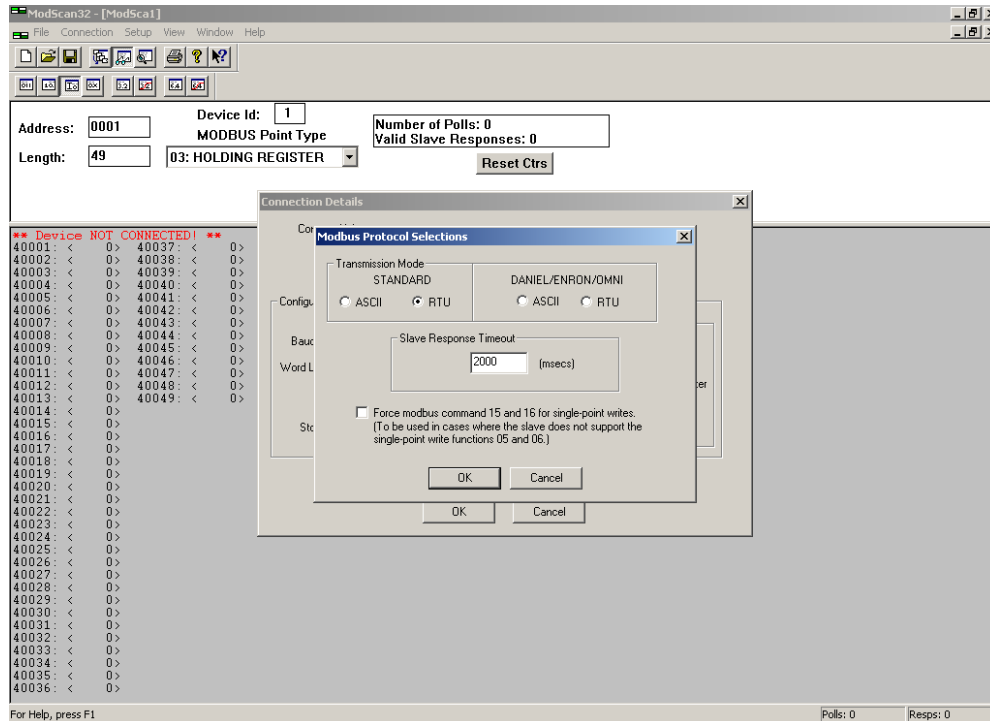

FIGURE 17. MODBUS PROTOCOL SELECTION DIALOG BOX

4. Click "OK" on the two open dialog boxes.

   You should notice in the upper right of the dialog box, the "Number of Polls" counter incrementing.

5. On the main ModScan screen (see Figure 18), Change the Address to 0001, the Length to 49 (ModLon Mapping Template 1 or 65 (ModLon Mapping Template 2, ModLon Mapping Template 3), and the Device ID to 1. From the MODBUS Point Type pull down menu, select "03: HOLDING REGISTER."

   The "Valid Slave Responses" should now be incrementing as the data on the screen is updated. The following are register addresses for Genset #1.

   40036 is Oil Pressure

40037 is Oil Temp.

40038 is Coolant Temp. (L)

40039 is Misc. Temp 1

40040 is Misc. Temp 2

40041 is Fuel Rate

40042 is Engine RPM

40043 is Engine Starts

40044 is Eng Runtime (high)

40045 is Eng Runtime (low)

40046 is Total kwh (high)

Refer to the register mapping information (Tables 9 thru 16) to view different pieces of data.

6. On the main ModScan menu (see Figure 19), change the Length to 49.

FIGURE 18. MODBUS POINT TYPE = HOLDING REGISTER

Accidental starting of the generator set can cause severe personal injury or death. During step 7, a "start" command is sent to the genset. If the genset Run/Off/Auto switch is in the Auto position, the genset WILL start.

7. To output a value from the ModLon to a network device, double click on register 40050. The Write Register dialog box is displayed (see Figure 19).

   NOTE: For more information on using the Write Register dialog box, see "Mod-Lon II Write Commands" on this page.

   If you enter a value of "1" and select "Update," Genset #1 starts and runs. If you double click on register 40050 again, enter a value of "0," and selecting "Update;" the Genset stops.

8. Review the mapping register information for other coils that you can manipulate.

By changing the Length on the main ModScan screen back to 49, the data registers will again update.

ModLon II Write Commands

The ModLon II is a single write device. It does not allow for multiple writes*. When sending write commands via ModBus the ModLon II must fully complete the write command on the LonWorks side before another ModBus write command can be implemented. Therefore the ModBus write commands must be about 625 ms apart. This time may increase depending on network configurations that use routers and depending on the number and type of channels used.

Writing ModBus Commands faster than 625 ms can cause the ModLon II to lock up and to recover, power must be cycled to the device or the Reset button must be pushed.

* ModLon II supports Function Code 06 and does not support Function Code 16.

* Fault codes are listed in the genset Operator's/Service Manuals.							Data = Multiplier x (Register + Offset)		

NOTES:

1. For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.

2. Value not supported in the 3200 controller.

3. Value not supported in the 3100 controller.

4. Value not supported.

5. With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1

For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

* Fault codes are listed in the genset Operator's/Service Manuals.							Data = Multiplr x (Reg + Offset)		

NOTES:

1. For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.

2. Value not supported in the 3200 controller.

3. Value not supported in the 3100 controller.

4. Value not supported.

5. With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1.
   For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

NOTES:

1. For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.

2. Value not supported in the 3200 controller.

3. Value not supported in the 3100 controller.

4. Value not supported.

5. With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1

For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

* Fault codes are listed in the genset Operator's/Service Manuals.							*Data = Multiplier x (Register + Offset)*		

NOTES:

1. For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.

2. Value not supported in the 3200 controller.

3. Value not supported in the 3100 controller.

4. Value not supported.

5. With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1. For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

NOTES:

1. For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.

2. Value not supported in the 3200 controller.

3. Value not supported in the 3100 controller.

4. Value not supported.

5. With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1.
For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

Appendix A. ModLon II with LonWorks Troubleshooting Guide

GENERAL

This appendix provides information on how to set up the ModLon II with LonWorks and includes some general solutions to problems that may arise. When using the ModLon II with LonWorks, always make sure that the communication configurations are set correctly.

MODLON II WITH LONWORKS

The first step is to make sure that the name of the ModLon II stencil template is the same as the name of the xif template and that it also matches the dipswitch setting on the ModLon II gateway. For example, if you are using xif Template3, make sure that the stencil is also Template3 and that the ModLon II dipswitch is set to 0010.

After dragging the stencil into the work space, the Enter Device Name dialog box shown in Figure 20 is displayed.

Click on the "Next" button to view the Specify Device Template dialog box (see Figure 21).
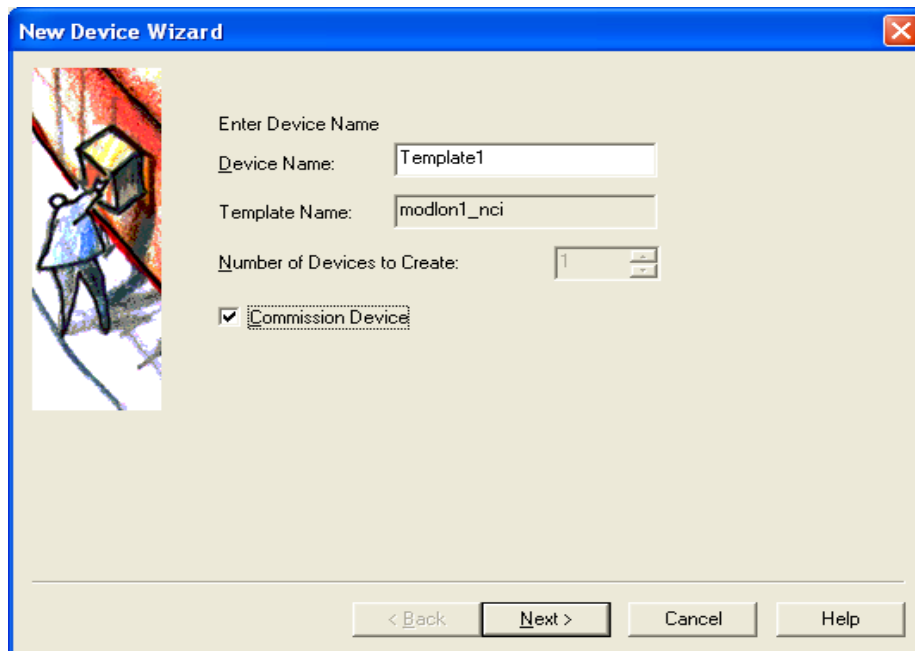

FIGURE 20. ENTER DEVICE NAME DIALOG BOX
FIGURE 21. SPECIFY DEVICE TEMPLATE DIALOG BOX

If it is necessary to change a template name so that they both match, IT IS IMPORTANT to note that you will have to change the xif file by browsing to the one that was installed by using the LonWorks Support Files.zip file. The example used here is the Template1.xif located at:

C:\LonWorks\Import\Cummins\FTT–10 Devices\ModLonII\Template1.xif

NOTE: The location of the LonWorks directory installed by the LonWorks Support Files.zip file should be in the same root directory that LonMaker for Windows was installed.
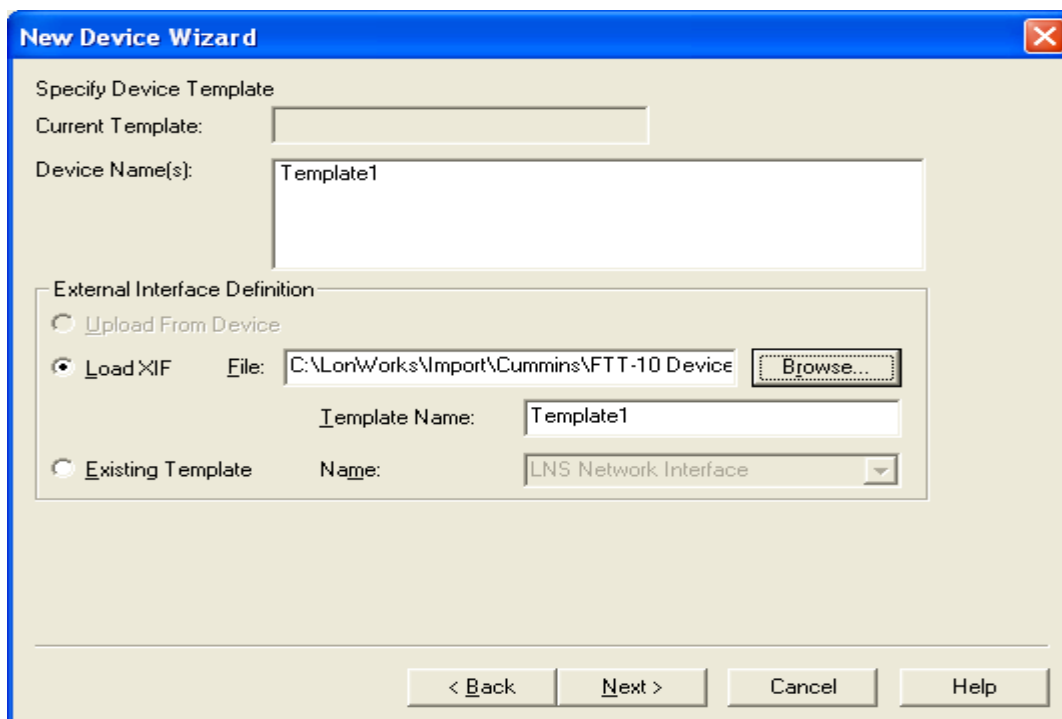

FIGURE 22. SELECTING THE APPROPRIATE XIF FILE

The rest of the windows will have the same function that the rest of the devices normally use. It will not be necessary to load the ModLonII.nxe file unless there is an "Application Error" with the ModLon (see the next section).

TROUBLESHOOTING

1. Make sure that the stencil template, xif template, and the ModLon II dipswitch settings all match. If you decide to change the dipswitch setting, it is important to:

    a. Decommission the device

    b. Disconnect the power

    c. Change the dipswitch setting

    d. Reconnect the power.

2. If an "Applicationless" error (see Figure 23) occurs while trying to commission the ModLon II, it will be necessary to load the ModLon II.nxe file to the device. Just commission the device and load the ModLon II.nxe file. Make sure that the xif file is the same as the stencil drawing.

3. If the error message "Cannot Communicate with Device" is displayed while commissioning the ModLon II, it is most likely because it was already commissioned under a different template and was not decommissioned while on-line. This error message is also displayed if one of the steps in #1 above was not followed.

When this error occurs, the "Cannot Communicate with Device" error message is displayed and the Service light of the ModLon II **does not** blink at a slow steady pace. The simplest fix is to make sure that the Stencil Template and the Template.xif names are the same. It is always important to decommission the device, disconnect the power, and then reconnect the power to the ModLon before switching it to a different template.

MODLON II WRITE COMMANDS

The ModLon II is a single write device; it does not allow for multiple writes. When sending write commands via the ModBus, the ModLon II must fully complete the write command on the LonWorks side before another ModBus write command can be implemented. Therefore, ModBus write commands must be about 625 ms apart. This time may increase, depending on network configurations that use routers and depending on the number and types of channels being used.

Writing ModBus commands faster than 625 ms can cause the ModLon II to lock up. To unlock it, either cycle power to the device or else press the Reset button.

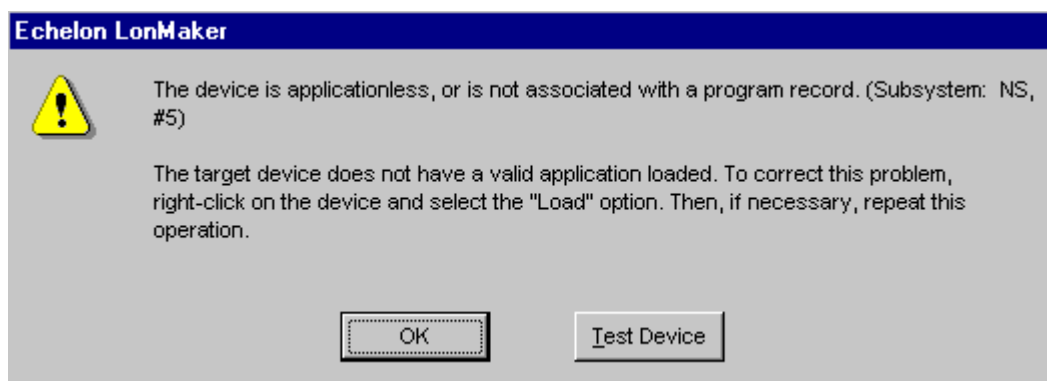

FIGURE 23. "THE DEVICE IS APPLICATIONLESS" ERROR MESSAGE

Appendix B. Communication Cables / DB9 Connection

RS-232 COMMUNICATIONS

The communications cable (part number 338–4629) is for communicating, via the DB9 connection of the ModLon II, to the com port of the PC in ModBus protocol. The communications cable has only three wires for RS-232 communications. ModLon II DB9 connection details are shown in Table 20.

TABLE 20. COMMUNICATIONS CABLE PIN DETAILS

DB9 Male Connection ModLon II	DB9 Female Connection PC
2	2
3	3
5	5

All of the communication protocols are listed in Table 21.

RS-485 COMMUNICATIONS

Due to the large number of devices that use different RS-485 wiring topologies for communicating, the end user is responsible for creating an interconnection cable for RS-485 communications between the ModLon II and the device.

A 4-wire RS-485 communications cable can be converted to a 2-wire RS-485 communications cable by shorting the RX+ and the TX– wires together as shown in Figure 24.

NOTE: If the shield is attached to earth on the device, leave the shield open on the ModLon II end. If the shield is connected to the signal ground on the device, connect the shield to the signal ground on the ModLon end.

FIGURE 24. CONVERTING THE RS-485 COMMUNICATIONS CABLE
