Proposal Type: Urgent
 General Category: Terrestrial Aeronomy
 Sub-Category: Radar
 Observation Category: Ionospheric
 Total Time Requested: 8 Hours

Proposal Title: Observation of Critical Ionization Velocity (CIV) Experiments on ARGOS
ABSTRACT:

A set of Critical Ionization Velocity, CIV, experiments will be performed aboard the spacecraft ARGOS. The CIV phenomenon is a plasma process in which gas traveling above a critical velocity in a background magnetized plasma becomes rapidly ionized. The process has a theoretical basis and confirmed laboratory observations. However, no unambiguous observations of CIV in space exist despite several previous attempts, and the process remains unquantified. Our objective is to characterize CIV-induced ionization above Arecibo Observatory.

Name	Institution	E-mail	Phone	Student
Keith M Groves	Air Force Research Laboratory	groves@plh.af.mil	1-781-377-3137	N

Service Observing Request

- None
- All of the observing run.
- Part of the observing run.
- Queue Observing

Remote Observing Request

- No
- Maybe
- Yes

Instrument Setup

430 MHz Gregorian 430 MHz CH receiver

Atmospheric Observation Instruments:

Photometer Spectrometer

Description of Observer Equipment:

Special Equipment or setup: Special setup: Software needs: Media needs: Raw CLOP data acquisition

RFI Considerations

Frequency Ranges Planned
