Proposal Title: High Precision Redshifts for Galaxies in Isolated Pairs

ABSTRACT:

High precision neutral hydrogen redshifts will be obtained for pairs of galaxies drawn from the UZC redshift catalog, restricted to pairs that are not members of groups of three or more galaxies. The pair sample encompasses larger magnitude differences than previously available, bridging the gap between earlier studies of pair dynamics and studies of small satellite galaxies around large spirals. This will allow a determination of the extent to which dynamical friction has influenced the orbits of the member galaxies.
