Proposal Type: Director Discretionary Time
 General Category: Astronomy
 Sub-Category: Continuum
 Observation Category: Extragalactic
 Total Time Requested: 15 Hours
 Minimum Useful Time: 3

Proposal Title: A Pilot Study of Intra-Day Variability (IDV) in Extragalactic Radio Sources with the Arecibo Telescope

ABSTRACT:

We will make multi-band polarization IDV observations with the Arecibo Telescope, which will give high sensitivity in order to detect weak variability. We will observe two targets: J010+1800 and PKS 0528+134. The observation will cover the LST range of 4:00 to 7:00 for four days. In order to test for variations on a longer timescale, we also request one night of observations a week before or after the initial set. Hence the total time we request is 15 hours.
