Proposal Type: Short
 General Category: Astronomy
 Observation Category: Earth-orbiting objects
 Total Time Requested: 4 - 12 Hours
 Minimum Useful Time: 1 hr

Proposal Title: UHF-Band Radar Satellite Tracking Test and Debris Survey

ABSTRACT:

This study attempts to demonstrate the high-precision tracking of known Earth-orbiting artificial satellites using bistatic radar with an array of receivers to measure range, range rate, and angular position. As a secondary objective, this study will attempt to sample the high-altitude orbital debris population using radar detection. High-altitude satellite tracking is now done predominantly by optical observation from terrestrial sites, with access opportunities limited by sky brightness and local weather. Such tracking offers limited precision. A very small number of targets are tracked with higher precision by lidar ranging, but the time required to make each measurement limits the use of this technique. Our intent is to demonstrate the occasional tracking of high-value with existing astronomical systems is technically achievable and offers high precision.

Name	Institution	E-mail	Phone	Student
Lauren C Wye	SRI International	lauren.wye@sri.com	650-859-3813	no

Remote Observing Request

- Observer will travel to AO
- Remote Observing
- In Absentia (instructions to operator)

Instrument Setup

430 G 430 Xmit

Atmospheric Observation Instruments:

Special Equipment or setup: none

RFI Considerations

Frequency Ranges Planned

430 MHz radar (422 - 442 MHz)
