Proposal Title: OH Observations of Three Comets in 2004

ABSTRACT:

We propose to observe three comets, C/2003 K4 (LINEAR), C/2002 T7 (LINEAR) and C/2001 Q4 (NEAT) during the spring of 2004. These comets are all expected to be bright enough to produce strong OH radio lines, so that we can map the strength of the line flux both at the nucleus and in the surrounding coma. Arecibo observations of OH at high spatial and velocity resolution help to determine the gas velocity in the coma, and the maps will allow us to detect any asymmetry in the outgassing from this comet. These three comets are predicted to have gas production rates in an ideal range to provide valuable constraints on the existence of and value of a production rate threshold for quenching.
